e-Stream™ Waste-stream Analysis

Your organization is liable for whatever it delivers to a landfill. A waste stream analysis can help you manage that risk and identify cost saving opportunities with waste reduction, re-use and recycling.

EMS Environmental offers clients the **e-Stream™** Waste-stream Analysis to identify opportunities for waste reduction, re-use, reconstitution, recycling and more responsible handling. This analysis identifies exposure to potential future liabilities and the environmental value of potential actions. **e-Stream™** analysis considers both your processes and the supporting facility to identify both facility and operating opportunities and their relative importance.

From **e-Stream™**, you get:

- Summary of your operation's waste sources, including materials and volumes
- Summary of disposal costs
- Re-use, Reconstitution and Recycling opportunities
- Immediately Actionable waste-stream recommendations based on the type of waste, waste volumes and where it is going
- Framework for longer term feasibility/design and procurement specifications
- Public Relations opportunities with customers - customers want to associate with environmentally responsible organizations
- Opportunities to promote employee retention and hiring - employees want to work for eco-friendly organizations

EMS Environmental's experience with disposal regulations, recycling opportunities and waste analysis enables you to make informed decisions.
